

Remote Monitoring Component Parts

The battery-powered radio modem provides wireless data transfer from the micro station to the base station.
(Battery powered)

The radio base station receives data from the radio modem. It plugs into the serial port on a computer. Requires 110 volt electrical supply.

The micro station data logger will operate for up to one year using four AA batteries.
(Battery powered)

A software program is used to log and manage the data from the temperature sensor. This system also requires a computer.

The sensor cable plugs into the micro station logger.
